

Rockville, MD 20857

Dear Dr. Henney,

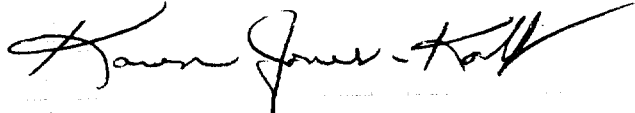

I am writing regarding the issue of genetically engineered foods, an idea, incidently, that greatly disturbs me.

There is a reason why people say "Don't fool with Mother Nature", something of which, a lot of scientists seem to be ignoring at this time..... you should not be playing God, this will ultimitly result in the demise of this planets destruction if you continue operating in this mind-space.

It's bad enough that the foods we grow in natural soil have no nutrients because of the depletion through chemical and herbicides used throughout the years, but now you want to alter the DNA structure of the foods we consume, and WHY, to try to make it "prettier", to make it "look" more nutritious, or to try to put back the vitamins and minerals your chemicals have removed?

I will continue to buy organically-grown fruits and vegetables, food that I am sure has Not been altered by human hands, and I urge you Very Strongly to support the labeling of bio-genetically altered foods. We do have a right to know what is in our foods, and you could face many lawsuits by not complying to this request.

Sincerely,

Karen Jones-Kolb
